for `pypty.iterative.run()`

API Reference	Default Data Type	Description
pypty.initialize	NumPy-like	Currently not used, but will be a feature in the future. Right now, whenever CuPy is available, it is used as the GPU backend. If no CUDA is detected, NumPy is used as a CPU replacement. We plan to add support for Apple Silicon, but we are waiting for an optimal library to appear.
pypty.dpc	python	
pypty.tcbf	module	
pypty.direct	str	Default data type for computations. Another option is "single".
pypty.iterative		
pypty.objective		
pypty.multislice_core		
pypty.fft		
pypty.utils		
pypty.se		
pypty.vaa	≡:	

API Reference	Default Data Type	Description
<code>pypty.initialize</code>	<code>str</code>	Path to the dataset. It can be an <code>.h5</code> file with a dataset named <code>"data"</code> containing a 3D measurement array <code>(N_measurements, y, x)</code> . Another option is a 4D .npy array or a 3D .npy array .
<code>pypty.dpc</code>		
<code>pypty.tcbf</code>	<code>numpy-array</code> or <code>None</code>	If you don't want to store data on disk, you can attach a numpy-array with your data to the parameters. If it's provided, <code>data_path</code> is ignored.
<code>pypty.direct</code>		
<code>pypty.iterative</code>	<code>numpy.ndarray</code> or <code>None</code>	Masks (virtual detectors) used for data compression. For uncompressed data, leave it as <code>None</code> .
<code>pypty.objective</code>		
<code>pypty.multislice_core</code>	<code>float</code>	Multiplier for data values. Used to rescale patterns on the fly without modifying the stored dataset. All patterns will be multiplied by this number.
<code>pypty.fft</code>		
<code>pypty.utils</code>	<code>int</code>	Padding applied to data. Use it to pad patterns on the fly without modifying the stored dataset. We recommend setting it to 1/4 of the pattern width for optimal sampling conditions in far-field mode.
<code>pypty.vaa</code> 	<code>int</code>	Binning factor for data. Used to bin patterns on the fly without modifying the stored dataset. All patterns will be binned by this number.
	<code>bool</code>	Flag indicating that one has to flip <code>ky</code> . Useful if patterns are flipped and you don't want to modify the stored dataset. Another option is to create a PyPty-style <code>.h5</code> dataset.

list

Shift vector (list with two-values) applied to measurements. Used to shift patterns on the fly without modifying the stored dataset. All patterns will be shifted by the specified number of pixels.

pypty.utils		
pypty.se	int	Print verbosity level: <code>0</code> for no printing, <code>1</code> for one overwritable line, <code>2</code> and <code>3</code> for moderate output. <code>4</code> gives the most detailed output.
pypty.vaa 		

API Reference	Default Data Type	Description
<code>pypty.initialize</code>	<code>float</code>	Acceleration voltage in kV.
<code>pypty.dpc</code>	<code>numpy.ndarray</code> or <code>None</code>	Mask for the aperture. Can be used for reciprocal probe constraint later (see section constraints).
<code>pypty.tcbf</code>	<code>str</code>	Type of reconstruction. Options: <code>"far_field"</code> or <code>"near_field"</code> .
<code>pypty.direct</code>	<code>float</code>	Alpha parameter for near-field reconstruction & flux preservation.
<code>pypty.iterative</code>		
<code>pypty.objective</code>	<code>numpy.ndarray</code>	Array of defocus values for near-field measurement. Irrelevant for far-field. It can contain either a single common defocus value for all measurements or individual values for each measurement.
<code>pypty.multislice_core</code>		
<code>pypty.fft</code>		Units: Angstroms.
<code>pypty.utils</code>	<code>float</code>	Spherical aberration coefficient. Units: Angstroms.
<code>pypty.se</code>		
<code>pypty.vaa</code> 		

API Reference

	Default Data	Description
	Type	
pypty.initialize	numpy.ndarray	Distances between object slices. Units: Angstroms. You can specify a single value common for all slices or provide individual values.
pypty.dpc	float	Pixel size in the x-direction (Angstroms) .
pypty.tcbf	float	Pixel size in the y-direction (Angstroms) .
pypty.direct		
pypty.iterative	tuple or None	Tuple describing the number of scan points in y- and x- directions . Required for constraining positions and tilts.
pypty.objective		
pypty.multislice_core	int	Number of slices in the object.
pypty.fft		
pypty.utils		
pypty.se		
pypty.vaa		

API Reference	Default Data Type	Description
<code>pypty.initialize</code>	<code>numpy.ndarray</code> <code>ray</code>	Initial guess for the transmission function to be retrieved. Shape: <code>(y, x, z, modes)</code> . If the <code>y</code> and <code>x</code> dimensions are insufficient for the scan grid, the object will be padded with ones.
<code>pypty.dpc</code>	<code>numpy.ndarray</code>	Real-space probe. Shape: <code>(y, x, modes)</code> . For advanced experiments, the probe can be 4D <code>(y, x, modes, subscans)</code> . If <code>None</code> , PyPty will automatically initialize the beam from the dataset.
<code>pypty.tcbf</code>	<code>ray</code> or <code>None</code>	
<code>pypty.direct</code>		
<code>pypty.iterative</code>	<code>numpy.ndarray</code>	Scan positions in pixels of the reconstruction. Shape: <code>[N_measurements, 2]</code> , formatted as <code>[[y0, x0], [y1, x1], ..., [yn, xn]]</code> . Single-shot experiments can define one common scan point, e.g., <code>[[0, 0]]</code> .
<code>pypty.objective</code>	<code>ray</code>	
<code>pypty.multislice_core</code>		
<code>pypty.fft</code>	<code>numpy.ndarray</code>	Tilt angles in real and reciprocal spaces . There are 3 types of tilts in PyPty framework: before, inside and after. First one is a beam tilt before the specimen, i.e. a shift in aperture plane. Second type is a tilt inside of a specimen, i.e. after each slice the beam is shifted in real space. Third type is a post-specimen tilt i.e. a shift in a detector plane. All three types of shifts are contained in this tilt array. Shape: <code>[N_measurements, 6]</code> . Format: <code>[[y0_before, x0_before, y0_inside, x0_inside, y0_after, x0_after], ..., [yN, xN]]</code> . Single-shot experiments can define one common tilt (with shape <code>[1, 6]</code>).
<code>pypty.utils</code>	<code>ray</code>	
<code>pypty.se</code>		
<code>pypty.vaa</code> 		
	<code>int</code>	Mode for applying tilts: <code>0, 3, 4</code> for inside , <code>2, 4</code> for before and <code>1, 3, 4</code> for after the

API Reference

pypty.initialize

`numpy.ndarray`
`ray` or
`float`

Static background intensity. Shape should match initial patterns but padded by `data_pad//upsample_pattern`. Use `0` for no static offset. If provided as positive float, the algorithm will initialize the background with a proper shape on its own.

pypty.dpc

`numpy.ndarray`

pypty.tcbf

`ray` or
`None`

Accounts for different currents (or exposure times) during measurements. If provided, must be a **1D array** with length matching `N_measurements`.

pypty.direct

pypty.iterative

Resizing

pypty.objective

	Default Data Type	Description
pypty.multislice_core	<code>str</code>	Wave propagation method. Options: "multislice", "better_multislice", and "yoshida". The last two are higher precision but slower .

pypty.fft

pypty.utils

pypty.se

`bool`

Allow **subpixel shifts**. If `False`, positions will be rounded to integers until refined.

pypty.vaa

`bool` or `int`
or
`pypty_lambd`
`a`

If position updates become too large, the object will be padded to accommodate the new scan grid. If set to a **positive integer**, resizing occurs when position updates exceed this value.

`int`

Extra space added around the object in **pixels**.

API Reference

	Default Data Type	Description
pypty.initialize		
pypty.dpc	float	Frequency cutoff for multislice beam propagation . Values larger than <code>2/3</code> can cause aliasing artifacts. Recommended $\leq 2/3$.
pypty.tcbf		
pypty.direct	float	Rolloff parameter for smooth frequency cutoffs.
pypty.iterative	float	Extra frequency cutoff for the full object . Ensures bandwidth limitation beyond the cropped ROIs of the multislice object.
pypty.objective		
pypty.multislice_core	bool	If <code>True</code> , the full transmission function will not be bandwidth-limited (only cropped ROIs will be). Recommended: <code>False</code> .
pypty.fft		
pypty.utils		
pypty.se		
pypty.vaa		

API Reference	Default Data Type	Description
<code>pypty.initialize</code>	<code>str</code>	Error metric for reconstruction comparison. Options: <code>"lsq_sqrt"</code> (Gaussian), <code>"ml"</code> (Poisson), <code>"lsq"</code> (classic summed squared error), and <code>"lsq_sqrt_2"</code> (modified Gaussian). If data is compressed via virtual detectors, the only option is <code>"lsq_compressed"</code> (summed squared error between signals).
<code>pypty.dpc</code>		
<code>pypty.tcbf</code>		
<code>pypty.direct</code>	<code>int</code>	Maximum number of epochs (iterations) .
<code>pypty.iterative</code>	<code>float or pypty_lambd</code>	Wolfe condition parameter (C1) . Prevents update steps from being too large. Must be > 0 and $< C2$. Larger values enforce shorter step size.
<code>pypty.objective</code>	<code>a</code>	
<code>pypty.multislice_core</code>	<code>float or pypty_lambd</code>	Wolfe condition parameter (C2) . Prevents update steps from being too small. Must be $> C1$ but < 1 . Larger values allow larger steps.
<code>pypty.fft</code>	<code>a</code>	
<code>pypty.utils</code>	<code>float or pypty_lambd</code>	Weight applied to the loss function .
<code>pypty.se</code>	<code>a</code>	
<code>pypty.vaa</code> <code>≡:</code>	<code>int or None</code>	Maximum number of forward-backward propagations per line search iteration . If exceeded, the update is rejected and history is reset. Use <code>None</code> or <code>np.inf</code> to disable.
	<code>float</code>	Factor for reducing step size when the first Wolfe condition is not met .
	<code>float</code>	Factor for increasing step size when the second Wolfe condition is not met . To prevent algorithm from going back and

API Reference

		forth during linesearch, multiplication of optimism and reduce_factor (or of any powers of them) should not be equal to 1.
<code>pypty.initialize</code>	<code>float</code>	Minimum step size. If the step falls below this value, the algorithm resets history . Use <code>0</code> to disable.
<code>pypty.dpc</code>	<code>int or np.inf or</code>	BFGS optimization history length. Values: <code>0</code> (Gradient Descent), <code>1</code> (Conjugate Gradient), <code>N>1</code> (Limited-memory BFGS), <code>np.inf</code> (Full BFGS).
<code>pypty.tcbf</code>	<code>pypty_lambd a</code>	
<code>pypty.direct</code>	<code>float or pypty_lambd</code>	Common step applied to all refinable quantities. By default, after the first iteration, a Barzilai-Borwein method is used to initialize the inverse Hessian, so most of the time, an update step of <code>1</code> should be accepted. Only during the very first iteration the linesearch might take some time to find an appropriate step.
<code>pypty.iterative</code>	<code>a</code>	
<code>pypty.objective</code>		
<code>pypty.multislice_core</code>		
<code>pypty.fft</code>	<code>bool or pypty_lambd</code>	Whether to consider the object as phase-only.
<code>pypty.utils</code>	<code>a</code>	
<code>pypty.se</code>	<code>bool or pypty_lambd a</code>	Optimize only the reciprocal-space phase (CTF) of the probe.
<code>pypty.vaa</code>	<code>bool or pypty_lambd a</code>	Optimize only the reciprocal-space amplitude (aperture) of the probe.
	<code>bool or pypty_lambd a</code>	Flag to reset optimization history. See section "lambda-types" in this document. If provided, history will be manually resetted.

API Reference

	Default Data Type	Description
pypty.initialize	bool or pypty_lambda	Whether to update the probe (1 for yes, 0 for no).
pypty.dpc	bool or pypty_lambda	Whether to update the object (1 for yes, 0 for no).
pypty.tcbf	bool or pypty_lambda	Whether to update probe positions (1 for yes, 0 for no).
pypty.direct	bool or pypty_lambda	Whether to update tilt angles (1 for yes, 0 for no).
pypty.iterative	bool or pypty_lambda	Whether to update beam current (1 for yes, 0 for no).
pypty.objective	bool or pypty_lambda	Whether to update aberration array (1 for yes, 0 for no).
pypty.multislice_core	bool or pypty_lambda	Whether to update static background (1 for yes, 0 for no).
pypty.fft	bool or pypty_lambda	Whether to update background (1 for yes, 0 for no).
pypty.utils		
pypty.se		
pypty.vaa	≡	tions

API Reference	Default Data Type	Description
<code>pypty.initialize</code>	<code>numpy.ndarray</code>	Array of aberration values for multiple beams. Useful for large fields of view where the beam changes. Shape: <code>[N_subscans, N_aberrations]</code> .
<code>pypty.dpc</code>	<code>str or None</code>	Path to an HDF5 file containing phase plates for different measurements. Dataset name should be <code>"configs"</code> . Shape: <code>[N_measurements, Y_probe, X_probe]</code> .
<code>pypty.tcbf</code>		
<code>pypty.direct</code>		
<code>pypty.iterative</code>	<code>numpy.ndarray</code>	Marker for multiple CTFs. Should be a 1D array of length <code>N_measurements</code> , where each entry corresponds to a CTF index in <code>aberrations_array</code> .
<code>pypty.objective</code>		
<code>pypty.multislice_core</code>	<code>numpy.ndarray</code>	Marker for probe variations. If provided, the probe should have shape <code>[y, x, modes, N_subscans]</code> , and this array should contain indices specifying which probe to use for each measurement.
<code>pypty.fft</code>		
<code>pypty.utils</code>		
<code>pypty.se</code>		
<code>pypty.vaa</code> 		

API Reference	Default Data Type	Description
pypty.initialize	bool	If <code>True</code> , data is loaded dynamically to save GPU memory. If <code>False</code> , all data is loaded at once (faster but memory-intensive).
pypty.dpc	bool or pypty_lamb da	If <code>True</code> , memory is managed intelligently , clearing cache when necessary to prevent memory fragmentation.
pypty.tcbf	bool	If <code>True</code> , FFT cache is removed periodically to save memory. (Experimental feature)
pypty.direct	int or str	
pypty.iterative		Batch size for multislice computation. Default value "auto" will automatically estimate a value that would fit into your memory, but ideally one should balance it by hand for a particular GPU. Increasing this can speed up reconstruction but requires more GPU memory. Super large values are also useless as at some point you will reach the limit the compute capability.
pypty.objective		
pypty.multislice_core		
pypty.fft		
pypty.utils		
pypty.se	numpy.dtype	Forces the dataset to be stored in a specified data type . Can help reduce memory usage at the cost of precision.
pypty.vaa 	bool	If <code>True</code> , preloads data to CPU before transferring it to GPU, improving transfer speeds for <code>.h5</code> datasets.
	bool	If <code>True</code> , pads data at the start of reconstruction (uses more memory but speeds up computation). If <code>False</code> , padding is applied on the fly to save memory.
	float	If compute batch is set to "auto", this ratio will be used to estimate a compute

API Reference

batch that would require
`memory_saturation` of the available GPU
memory. If `compute_batch` is integer,
`memory_saturation` is ignored.

API Reference

DESCRIPTION

Dictionary containing PyPTY experimental and reconstruction settings.

`pypty.initialize`

List (for integers) of binning factors for each iteration of the CTF fit.

`pypty.dpc`

TYPE: `list` **DEFAULT:** `[8]`

`pypty.tcbf`

Whether to save intermediate tcBF images and shift estimates.

`pypty.direct`

TYPE: `bool` **DEFAULT:** `True`

`pypty.iterative`

Whether to include probe rotation angle in the fit.

`pypty.objective`

TYPE: `bool` **DEFAULT:** `True`

`pypty.multislice_core`

Initial guess for aberrations. If None, `n_aberrations_to_fit` zeros will be used.

`pypty.fft`

TYPE: `list` **DEFAULT:** `None`

`pypty.utils`

Number of aberrations to fit if no initial guess is provided.

`pypty.se`

TYPE: `int` **DEFAULT:** `12`

`pypty.vaa`

Reference used for cross-correlation ("bf" or "zero").

TYPE: `string` **DEFAULT:** `'bf'`

Radius (in pixels) of the interpolation box for sub-pixel shift refinement.

TYPE: `int` **DEFAULT:** `10`

Factor for refining cross-correlation to estimate sub-pixel shifts.

TYPE: `int` **DEFAULT:** `3`

API Reference

	Type of cross-correlation to use ("phase" or "classical").	
<code>pypty.initialize</code>	TYPE: str	DEFAULT: 'phase'
	Threshold (0–1) to ignore large shift outliers in the fit.	
<code>pypty.dpc</code>	TYPE: float	DEFAULT: None
	Radius for optional circular blur mask applied to patterns.	
<code>pypty.tcbf</code>	TYPE: int	DEFAULT: None
<code>pypty.direct</code>	Number of scan pixels to pad around the dataset (auto if None).	
<code>pypty.iterative</code>	TYPE: int	DEFAULT: None
<code>pypty.objective</code>	Aperture mask. If None, attempts to extract from parameters.	
<code>pypty.multislice_core</code>	TYPE: ndarray	DEFAULT: None
<code>pypty.fft</code>	Subregion for CTF fitting: [left, top, right, bottom].	
<code>pypty.utils</code>	TYPE: list	DEFAULT: None
<code>pypty.se</code>	Whether to compensate for pattern drift in large FOVs.	
<code>pypty.vaa</code>	TYPE: bool	DEFAULT: False
	Whether to store low-frequency drift corrections in <code>params</code> .	
	TYPE: bool	DEFAULT: True
	Factor to upsample the scan via interpolation (experimental).	
	TYPE: int	DEFAULT: 1
	Binning factor before peak detection in cross-correlation.	

API Reference

<code>pypty.initialize</code>	<code>TYPE: int</code>	<code>DEFAULT: 1</code>
Use analytical peak refinement formula for phase correlation.

inmission coherent Bright Field) reconstruction.

F image on an upsampled scan grid from 4D-STEM ifts to align the bright field pixel images and ie. Prior to calling this function, it is recommended e to update `pypty_params`.

API Reference

:SCRIPTION

ctionary containing experimental parameters and construction settings. This should include keys such as 'ita_path', 'scan_size', 'aperture_mask', 'acc_voltage', etc.

`pypty.initialize`

'PE: dict

`pypty.dpc`

Sampling factor for the scan grid. Default is 5.

`pypty.tcbf`

'PE: int **DEFAULT:** 5

`pypty.direct`

mber of additional scan positions to pad on each side to id wrap-around artifacts. Default is 10.

`pypty.iterative`

'PE: int **DEFAULT:** 10

`pypty.objective`

True, compensates for low-frequency drift of the aperture. quires that run_tcbf_alignment has been executed to provide ft corrections. Default is False.

`pypty.multislice_core`

'PE: bool **DEFAULT:** False

`pypty.fft`

recision for floating point computations. Use 64 for higher cision or 32 for lower memory usage. Default is 64.

`pypty.utils`

'PE: (64, 32) **DEFAULT:** 64

`pypty.se`

True, shifts are rounded and alignment is performed using ay roll operations. If False, FFT-based subpixel shifting is ed. Default is False.

`pypty.vaa`

'PE: bool **DEFAULT:** False

ckend array module (e.g., numpy or cupy). Default is cupy.

'PE: module **DEFAULT:** numpy

g to save the output image. If True, the image is saved to sk. Ignored if 'save_preprocessing_files' is set in 'pty_params'. Default is 0 (False).

'PE: bool or int **DEFAULT:** 0

API Reference

maximum number of FFTs to perform in parallel for vectorized processing. Default is 100.

PE: int

DEFAULT: 100

`pypty.initialize`

scaling factor for the data in reciprocal space. Default is 1 (no scaling).

`pypty.dpc`

PE: int

DEFAULT: 1

`pypty.tcbf`

`pypty.direct`

image reconstructed on the upsampled grid.

`pypty.iterative`

ngströms after upsampling.

`pypty.objective`

`pypty.multislice_core`

ignment

`pypty.fft`

compressed 4D-STEM data and masked bright-field

`pypty.utils`

to the shifts between the individual pixel images of

`pypty.se`

ne as run_tcbf_alignment, but for compressed data.

cross-correaltion.

`pypty.vaa`

API Reference

	DESCRIPTION
<code>pypty.initialize</code>	Dictionary containing experimental and reconstruction settings. TYPE: <code>dict</code>
<code>pypty.dpc</code>	Number of fitting iterations to perform. TYPE: <code>int</code>
<code>pypty.tcbf</code>	Whether to save intermediate tcBF images and shift maps. Default is True. TYPE: <code>bool</code> DEFAULT: <code>True</code>
<code>pypty.direct</code>	
<code>pypty.iterative</code>	Whether to include probe rotation angle in the CTF fit. Default is True. TYPE: <code>bool</code> DEFAULT: <code>True</code>
<code>pypty.objective</code>	
<code>pypty.multislice_core</code>	Initial guess for the aberration coefficients. If None, it will be inferred or zero-initialized. TYPE: <code>list or None</code> DEFAULT: <code>None</code>
<code>pypty.fft</code>	
<code>pypty.utils</code>	Number of aberration coefficients to fit if <code>aberrations</code> is not provided. Default is 12. TYPE: <code>int</code> DEFAULT: <code>12</code>
<code>pypty.se</code>	
<code>pypty.vaa</code>	"bf" to use the tcBF image as a reference, "zero" to use the central pixel. Default is "bf". TYPE: <code>str</code> DEFAULT: <code>'bf'</code>
	Size of the cropped region around the cross-correlation peak for sub-pixel refinement. Default is 10. TYPE: <code>int</code> DEFAULT: <code>10</code>
	Upsampling factor for sub-pixel interpolation. Default is 3.

API Reference

`pypty.initialize`

TYPE: `int` **DEFAULT:** 3

Cross-correlation method: "phase" (recommended) or "classic". Default is "phase".

`pypty.dpc`

TYPE: `str` **DEFAULT:** 'phase'

Threshold to reject large shift outliers during fitting.
Value between 0 and 1. Default is None.

`pypty.tcbf`

TYPE: `float or None` **DEFAULT:** None

Width of blur kernel for patterns prior to analysis.
Default is None.

`pypty.direct`

TYPE: `int or None` **DEFAULT:** None

`pypty.objective`

Number of scan pixels to pad around the scan to prevent wrap-around. Default is auto.

`pypty.multislice_core`

TYPE: `int or None` **DEFAULT:** None

`pypty.fft`

Aperture mask defining pixels to analyze. If None, it will be loaded from `params`.

`pypty.utils`

TYPE: `ndarray or None` **DEFAULT:** None

`pypty.se`

Optional subregion [left, top, right, bottom] on which to perform the alignment. Default is None.

`pypty.vaa`

TYPE: `list or None` **DEFAULT:** None

Whether to compute and correct for slow drifting of the aperture over time. Default is False.

TYPE: `bool` **DEFAULT:** False

If True, saves the low-frequency correction back into `params`. Default is True.

TYPE: `bool` **DEFAULT:** True

Experimental: interpolate scan grid by this factor (e.g. 2)

API Reference

`pypty.initialize`

Experimental: interpolate down grid by this factor (e.g., 2 for 2x upsampled grid). Default is 1.

TYPE: `int`

DEFAULT: 1

`pypty.dpc`

Binning factor applied to cross-correlation maps before refinement. Default is 1.

TYPE: `int`

DEFAULT: 1

`pypty.tcbf`

If True, uses analytical subpixel peak estimation for phase correlation. Default is False.

TYPE: `bool`

DEFAULT: False

`pypty.direct`

Scaling factor for least squares residuals (`f_scale`).

`pypty.iterative`

n + ptychography)

`pypty.objective`

of reconstruction parameters including fitted aberrations and

`pypty.multislice_core`

TYPE: `float`

DEFAULT: 1

`pypty.fft`

Loss type for least squares optimizer. E.g., "linear", "huber". Default is "linear".

`pypty.utils`

`:convolution (WDD).`

TYPE: `str`

DEFAULT: 'linear'

`pypty.se`

`:distribution Deconvolution to the provided data,`
`Tolerance for optimizer convergence (ftol). Default is`
`1e-8.`

`pypty.vaa`

`:action of complex objects and probes. It handles`
`NumPy) computations based on the availability`
`TYPE: float`
`DEFAULT: 1e-08`

tion parameters (object, probe, positions, tilts, etc.).

API Reference

DESCRIPTION

Complex 4D object (current estimate)

TYPE: ndarray

`pypty.initialize`

Complex probe (y,x,modes) optionally 4D
(y,x,modes, scenatios)

TYPE: ndarray

`pypty.tcbf`

Integer beam positions in pixels [[y0,x0],.. [yn, xn]]. Note: units are pixels, not angstrom!

TYPE: ndarray

`pypty.direct`

Float sub-pixel postions for more precise beam shift. Note: units are pixels, not angstrom!

TYPE: ndarray

`pypty.iterative`

`pypty.objective`

`pypty.multislice_core`

`pypty.fft`

`pypty.utils`

`pypty.se`

`pypty.vaa`

Beam tilts in radians, shape should be (N_measurements, 6), where first two tilts are applied before the sample, second and third are applied inside (tilted propagator) and two last are applied after the sample

TYPE: ndarray

legacy paramter, actually is not really required. It is a correction that is added to the tilts array.

TYPE: ndarray

either just one value for a common slice spacing or list of values for each slice. If object has N slices, it should have N-1 entries.

TYPE: ndarray

array or h5-dataset with diffraction patterns

API Reference

`pypty.initialize`

Should be 3D, [N_measurements, y,x]

TYPE: ndarray

`pypty.dpc`

Electron wavelength in Angstrom

TYPE: float

`pypty.tcbf`

do you refine the beam?

`pypty.direct`

TYPE: float

`pypty.iterative`

do you refine the object?

TYPE: float

`pypty.objective`

do you refine the positions?

`pypty.multislice_core`

do you refine the tilts?

TYPE: float

`pypty.utils`

optional, if the data is compressed, you should provide the 3D array with virtual detectors [N_detectors, y,x].

`pypty.vaa`

TYPE: ndarray

real-space pixel size in x-direction (Angstrom).

TYPE: float

real-space pixel size in y-direction (Angstrom).

TYPE: float

"far_field" or "near_field". Changes the exit-wave propagation regime.

API Reference

`pypty.initialize`

TYPE: `string`

Spherical aberration (Angstrom). Only needed for near-field propagation.

`pypty.dpc`

TYPE: `float`

Array of exit-wave defocus values (Angstrom). Only needed for near-field propagation.

`pypty.tcbf`

TYPE: `ndarray`

Flux-preserving correction for near-field propagation.

`pypty.direct`

TYPE: `float`

`pypty.iterative`

Cutoff (fraction smaller than 1) beyond which the Fourier-space is cleaned.

`pypty.multislice_core`

TYPE: `float`

Smooth rolloff for Fourier masking

`pypty.fft`

TYPE: `float`

`pypty.utils`

string indicating the method for split-step integration

`pypty.se`

TYPE: `string`

`pypty.vaa`

sequence of measurement indices used for loss and grad calculation (should be sorted)

TYPE: `ndarray`

boolean flag. should be True for lazy loading.

TYPE: `bool`

multiplicative factor applied to data on the fly.

TYPE: `int`

API Reference

`pypty.initialize`

padding factor applied to data on the fly.

TYPE: `int`

`pypty.dpc`

path to h5 dataset containing phase plates for each measurement.

TYPE: `string`

`pypty.tcbf`

weight applied to the main part of the loss

TYPE: `float`

`pypty.direct`

binning factor applied to data on the fly

TYPE: `int`

`pypty.iterative`

shift vector in pixels (y,x) applied to data on the fly

TYPE: `tuple`

`pypty.multislice_core`

virtual "decompression" of the data used to enlarge the probe window

TYPE: `int`

`pypty.utils`

real-valued array describing the square root of the static offset on the diffraction patterns.

TYPE: `ndarray` or `float`

`pypty.vaa`

do you refine the static background?

TYPE: `float`

flag for tilting

TYPE: `int`

TYPE: `ndarray`

DESCRIPTION

Probe wavefunction with shape [N_batch, y,x, modes]

TYPE: ndarray

pypty.initialize

Object slices with shape [N_batch, y,x, z, modes].

TYPE: ndarray

pypty.tcbf

Number of object slices.

TYPE: int

pypty.direct

Number of object modes.

TYPE: int

pypty.objective

Number of probe modes.

TYPE: int

pypty.multislice_core

Slice thicknesses.

TYPE: ndarray

pypty.utils

Electron wavelength.

TYPE: float

pypty.se

Spatial frequency grids.

TYPE: ndarray

pypty.vaa

Spatial frequency grids.

TYPE: ndarray

Spatial frequency grids.

TYPE: ndarray

Mask to exclude undesired frequencies.

API Reference

`pypty.initialize`

TYPE: `ndarray`

If True, use the same distance for all slices.

TYPE: `bool`

`pypty.dpc`

Beam tilts with shape N_batch

TYPE: `ndarray`

`pypty.tcbf`

Beam tilts with shape N_batch

TYPE: `ndarray`

`pypty.direct`

Damping frequency cutoff.

TYPE: `float`

`pypty.objective`

Rolloff rate for the damping filter.

TYPE: `float`

`pypty.multislice_core`

Full propagator in Fourier space (optional).

`pypty.fft`

TYPE: `ndarray or None`

`pypty.utils`

Half-step propagator (optional).

`pypty.se`

TYPE: `ndarray or None`

`pypty.vaa`

Clean propagation mask.

TYPE: `ndarray`

This array contains interediate exit-waves

TYPE: `ndarray`

This array contains final exit-wave

TYPE: `ndarray`

Numerical types.

API Reference

TYPE: `dtype`

Numerical types.

TYPE: `dtype`

`pypty.initialize`

`ON`

`pypty.dpc`

tack of propagated waves.

`pypty.tcbf`

`:ray`

`pypty.direct`

`:ave`

`pypty.iterative`

`:ray`

`pypty.objective`

`S`

`pypty.multislice_core`

obe, and tilts for the "better_multislice" wave

`pypty.fft`

`pypty.utils`

`pypty.se`

`pypty.vaa`

API Reference

`pypty.initialize`

DESCRIPTION

Gradient of the loss with respect to the final exit wave.

TYPE: `ndarray`

`pypty.dpc`

Stack of intermediate wavefields saved during the forward pass.

TYPE: `ndarray`

`pypty.tcbf`

The sliced object with shape [batch, y, x, z, modes].

TYPE: `ndarray`

`pypty.iterative`

Gradient accumulator for the object slices.

TYPE: `ndarray`

`pypty.multislice_core`

Gradient accumulator for the tilts.

TYPE: `ndarray`

`pypty.fft`

Whether all slices have the same thickness.

TYPE: `bool`

`pypty.utils`

Thickness per slice.

TYPE: `ndarray`

`pypty.vaa`

Frequency mask used in propagation.

TYPE: `ndarray`

Wavelength of the probe in Ångströms.

TYPE: `float`

Spatial frequency grids.

TYPE: `ndarray`

API Reference

`pypty.initialize`

Spatial frequency grids.

TYPE: `ndarray`

`pypty.dpc`

Spatial frequency grids.

TYPE: `ndarray`

`pypty.tcbf`

Beam tilt values per batch.

TYPE: `float`

`pypty.direct`

Beam tilt values per batch.

TYPE: `float`

`pypty.iterative`

Number of slices in the object.

`pypty.objective`

TYPE: `int`

`pypty.multislice_core`

Number of probe modes.

TYPE: `int`

`pypty.fft`

Number of object modes.

`pypty.utils`

TYPE: `int`

`pypty.se`

Index for updating `tilts_grad`.

TYPE: `int`

`pypty.vaa`

Whether to update tilts (0 = off).

TYPE: `int`

Full propagator for the current slice.

TYPE: `ndarray`

`ace`

Half-step propagator.

TYPE: `ndarray`

API Reference

`pypty.initialize`

Cutoff for high frequencies in damping.

TYPE: `float`

`pypty.dpc`

Smoothing width for damping filter.

TYPE: `float`

`pypty.tcbf`

Specifies which tilts to optimize.

TYPE: `int`

`pypty.direct`

Number of scan positions processed in batch.

TYPE: `int`

`pypty.iterative`

FFT mask used to remove unstable frequencies.

`pypty.objective`

TYPE: `ndarray`

`pypty.multislice_core`

Indices to scatter object gradients into global coordinates.

`pypty.fft`

TYPE: `ndarray`

`pypty.utils`

Indices to scatter object gradients into global coordinates.

`pypty.se`

TYPE: `ndarray`

`pypty.vaa`

Floating point precision.

TYPE: `dtype`

Complex precision.

TYPE: `dtype`

ION

API Reference

radient of the object slices.

`irray`

`pypty.initialize`

f the probe (summed over object modes).

`pypty.dpc`

`irray`

`pypty.tcbf`

It gradients.

`pypty.direct`

`irray`

`pypty.iterative`

`pypty.objective`

gation using an yoshida integrator (5th order

`pypty.multislice_core`

ickness).

TYPE: float

`pypty.vaa`

Array of aberration coefficients.

TYPE: ndarray or ndarray

Array of beam current values.

TYPE: ndarray or ndarray

Whether to save beam current.

TYPE: bool

Whether to trigger checkpoint saving.

API Reference

`pypty.initialize`

TYPE: bool

Whether to log loss. If set to 2, log full breakdown of constraints.

`pypty.dpc`

TYPE: bool or int

List of constraint term contributions to the loss.

`pypty.tcbf`

TYPE: list

Step size applied in the optimizer.

`pypty.direct`

TYPE: float

`pypty.iterative`

Number of line search iterations.

TYPE: int

`pypty.objective`

Initial directional derivative.

`pypty.multislice_core`

TYPE: float

`pypty.fft`

New directional derivative after the step.

`pypty.utils`

TYPE: float

Step size suggested by BFGS or optimizer.

`pypty.se`

TYPE: float

`pypty.vaa`

Start time of the epoch (used for timing).

TYPE: float

NumPy or CuPy module used for computation.

TYPE: module

Warning string to be logged.

DESCRIPTION

`pypty.initialize`

Input probe. If set to "aperture", the aperture mask is used. If None, the probe is generated based on the mean pattern.

TYPE: `ndarray, str, or None`

`pypty.dpc`

Padding size applied to the data.

TYPE: `int`

`pypty.tcbf`

Mean pattern used to generate the probe if no probe is provided.

TYPE: `ndarray or None`

`pypty.direct`

`pypty.iterative`

Aperture mask used when probe is set to "aperture".

TYPE: `ndarray`

`pypty.multislice_core`

Flag indicating if tilt mode is active.

`pypty.fft`

TYPE: `bool`

`pypty.utils`

Tilt values.

TYPE: `ndarray`

`pypty.se`

Measured dataset.

TYPE: `ndarray`

`pypty.vaa`

Factor used to threshold the dataset for aperture estimation.

TYPE: `bool or float`

Pixel size in the x-direction in angstroms.

TYPE: `float`

Acceleration voltage in keV.

API Reference

`pypty.initialize`

TYPE: `float`

Factor to scale the data intensity.

`pypty.dpc`

TYPE: `float`

Optional masks to apply to the mean pattern.

`pypty.tcbf`

TYPE: `ndarray or None`

Vector indicating the shift to be applied to the data.

`pypty.direct`

TYPE: `list or tuple of int`

Binning factor.

`pypty.iterative`

TYPE: `int`

`pypty.objective`

Upsampling factor applied to the pattern.

`pypty.multislice_core`

TYPE: `int`

Complex data type for CPU computations.

`pypty.fft`

TYPE: `dtype`

`pypty.utils`

Flag controlling verbosity.

`pypty.se`

TYPE: `int`

`pypty.vaa`

Identifier for the reconstruction algorithm.

TYPE: `str`

Shape of the measured data.

TYPE: `tuple`

Number of object modes.

TYPE: `int`

Marker array for probe scenarios.

API Reference

`pypty.initialize`

TYPE: `ndarray` or `None`

Type of reconstruction ("near_field" or "far_field").

TYPE: `str`

`pypty.dpc`

Array of defocus values.

TYPE: `ndarray`

`pypty.tcbf`

Spherical aberration coefficient.

TYPE: `float`
